CPE 314 — Software Design & Software Design Laboratory

Week 8 — Project Proposal

Due end of Week 8 session | 10% of the Finals Term Grade | Scored out of 100

Group Name / No.:	Group 4
Members:	Gabasa, Dexter Rosal, Wendil Coloscos, Brent Lagaya, John Carlo Labra, Simone
Repository URL:	https://github.com/ColoscosBrent/cpe314-69323-capstone-team-04
Chosen Theme (circle one):	A B C D E F G H I J K L M N O P ◎ R S T ☐ Custom Selected: Q — Vehicle Rental & Fleet Management (attach approval)
API You Will Use:	NHTSA vPIC API — https://vpic.nhtsa.dot.gov/api

1. One-Paragraph Pitch

Our app is a vehicle rental and fleet management desktop app built with JavaFX. It is for small rental shops that rent out cars, SUVs, and motorcycles. Many of these shops still write rentals on paper, so it is easy to lose track of which vehicle is out and who is next in line. Our app lets the shop keep a list of its vehicles, record who rented what and for how long, and keep a waiting list when a vehicle is already out. Real make and model data comes from the NHTSA vPIC API and everything is saved in a SQLite database. A dashboard shows the most rented vehicle type and how busy the fleet is over time.

2. Entity-Relationship Sketch

Renter(id PK, name, contact)

Vehicle(id PK, type, make, model, year, dailyRate, mileage, categoryPath)

Rental(id PK, renterId FK, vehicleId FK, startDate, endDate, milesDriven)

Relationships: Renter --1:M--> Rental (one renter can have many rentals) and Vehicle --1:M--> Rental (one vehicle can be in many rentals over time). type is one of SEDAN | SUV | MOTORCYCLE.

Summary: we have 3 entities (Renter, Vehicle, Rental), all saved in SQLite using JDBC with PreparedStatement. The waiting-list Queue and the undo Stack are only in memory, not tables. categoryPath is a text like "Car > Sedan > Compact Sedan" that we use to build the category tree.

3. Feature Checklist

Planned Feature	Requirement(s) It Satisfies
Vehicle abstract class with Sedan, SUV, and Motorcycle subclasses. Each one has its own daily rate and mileage fee rules.	Object-Oriented Design
A Queue for the reservation waiting list and a Stack of check-outs so we can undo the last one.	Data Structure (Queue and Stack)
Vehicle category tree (Car > Sedan > Compact Sedan). A recursive method adds up the total fleet mileage.	Recursion
SQLite tables for Renter, Vehicle, and Rental, accessed with JDBC PreparedStatement.	Data Modeling + Database
Get make, model, and year data from the NHTSA vPIC API, parse the JSON, and use it when adding a vehicle.	API Consumption
Import the old rental history (CSV) using a JavaFX Task on a background thread, so the window does not freeze.	Concurrency
GUI with an add-vehicle form, check-out and check-in buttons, an undo button, an import button, and a dashboard tab.	Event-Driven GUI (3+ controls with handlers)
Dashboard: find the most rented vehicle type and the fleet utilization over time. Shown as a bar chart and a line chart with titles and axis labels.	Data Mining + Data Visualization
At least 6 JUnit 5 tests: rate and fee of each vehicle type, queue order, stack undo, recursive mileage (including an empty tree), and CSV edge cases.	Automated Testing

4. Task Split

Member	Primary Responsibility (this milestone)
Gabasa, Dexter	Database: SQLite tables for vehicles, renters, and rentals, and the JDBC code with PreparedStatement. Database tests.
Rosal, Wendil	Vehicle category tree and the recursive fleet mileage method. Maven project setup. Tests for these.
Coloscos, Brent	Domain model and OOD: Vehicle abstract class, its 3 subclasses, and the rate and fee logic. Tests for these.
Lagaya, John Carlo	Rental and Renter classes, the waiting list Queue, the undo Stack, and the CSV import on a background thread. Tests for these.
Labra, Simone	NHTSA vPIC API: sending the request and parsing the JSON. JavaFX GUI (forms, buttons, dashboard) and the bar and line charts.
All members	Commit our own work to the team repo, review each other's pull requests, and attend the Week 8-9 consultation.

5. Public API You Plan to Use

NHTSA vPIC API (https://vpic.nhtsa.dot.gov/api). It gives real vehicle make, model, and year data from the US government in JSON. No API key needed.

Example call: https://vpic.nhtsa.dot.gov/api/vehicles/GetModelsForMake/honda?format=json

We will cache the response so we do not call the API too much.

6. Risks / Open Questions

- How will we keep the window responsive while importing a large rental history CSV?
- Should the category tree be saved as a text path in the Vehicle table or in its own table?
- How will we read the JSON from the API in Java, and is it OK to use a library like Gson?
- What should the app show when the API is slow or down?
- How will we count utilization over time correctly when rentals overlap?
